Trendy Bazaar: Feature Specification

A complete inventory of what the Trendy Bazaar online store does and how it is built, written so the same features can be rebuilt on another project. Reflects the site as of 12 October 2026.

How to use this document (read this first)

This is a brief for an AI coding assistant working in a **different project folder**. The owner wants every feature below implemented on that project.

1. **Inspect the target project before writing code.** Find out its framework, styling, routing, backend and hosting. Adapt each feature to that stack; do not assume it matches the reference stack in section 1.
2. **Keep the target project's own brand.** The store name, colours, logo, product categories, phone numbers, email addresses and URLs in this document belong to Trendy Bazaar. Replace them with the target project's values and ask the owner for anything missing (list in section 16).
3. **Check what already exists.** List which features the target project already has, which are partial and which are missing, and confirm the plan with the owner before a large build.
4. **Build in the order of section 17** unless the owner says otherwise. Later features depend on earlier ones.
5. **Reference implementation:** the original source is at `D:\devtimize\trendy-bazaar` on the owner's machine (GitHub `shoaib1920/trendybazar`). If that folder is readable, read the files named in section 18 for exact behaviour. If not, this document is meant to be sufficient.
6. **Never copy secrets.** This document lists the names of environment variables only. Ask the owner for values and keep them in git-ignored env files and in the hosting provider's settings.

1. Reference stack

Layer	What Trendy Bazaar uses
Front end	React 19 + TypeScript, built with Vite 6. Tailwind CSS 4. Icons from `lucide-react`. Single-page app with its own small router (History API), one global React context holding all shop state.
Database	Firebase Firestore (products, orders, discounts, customers, abandoned carts, restock requests, phone limits). The browser talks to Firestore directly; access is controlled by security rules.
Admin login	Firebase Authentication, email and password, one allowed admin email.
Images	Cloudinary unsigned uploads from the browser; delivery URLs get `f_auto,q_auto,c_limit,w_N` for right-sized images.

Server functions	Vercel serverless functions in `/api`: AI chat, courier tracking, order email, SEO page rendering, sitemap. The same handlers are mounted in the Vite dev server so they work with `npm run dev`.
AI	Google Gemini through `@google/genai` (server side only).
Email	`nodemailer` over Gmail SMTP with an app password (server side only).
Other libraries	`driver.js` (guided tour), `react-easy-crop` (image editor).
Hosting	Vercel, with rewrites in `vercel.json`. Custom domain.
Offline/demo mode	If Firebase env values are absent, everything falls back to `localStorage` so the site still runs. Every Firebase call checks an `isFirebaseConfigured` flag first.

2. Business rules and constants

These numbers drive behaviour in many places. Ask the owner whether the new project uses the same values, and keep each in one shared constant.

Rule	Value on Trendy Bazaar
Currency and market	Pakistani rupees (shown as "Rs. 1,234"), Pakistan only.
Delivery fee	Flat Rs. 150. Free when the item subtotal is Rs. 3,500 or more.
Delivery time shown	2 to 4 working days; a per-city estimate table on the product page.
Exchange policy shown	7-day easy exchange.
Gift box and card	Optional add-on, Rs. 250, with a short note.
Order ID format	`TB-` + 7 random characters from `23456789ABCDEFGHJKLMNPQRSTUVWXYZ` (no 0/O/1/I). Random, not sequential, because anyone can read an order by its exact ID.
Phone numbers	Any common Pakistani mobile format is normalised to `923XXXXXXXXX` ("phone key"). Invalid numbers block checkout. The phone key identifies a customer everywhere.
Order spam limit	At most 3 orders per phone number in any 24 hours, enforced in the database rules as well as the UI.
Loyalty points	1 point = Rs. 1. Earn 5% of the item subtotal when the order is delivered. Points may cover at most 20% of an order.
Low stock	Admin flags products with 5 or fewer in stock. Product cards show "Only N left" at 4 or fewer.
Unconfirmed order alert	A Pending order older than 24 hours is flagged in the admin panel.
Abandoned cart	A saved checkout draft counts as abandoned after 30 minutes without an order.
Order statuses	Pending, Confirmed, Packed, Shipped, Out for Delivery, Delivered (forward path); Cancelled and Returned (side exits).
Couriers offered to admin	TCS, Leopards Courier, Trax, PostEx, M&P, Call Courier, Pakistan Post, Self delivery.

Payment methods	Cash on Delivery, and JazzCash / Easypaisa by manual transfer. No card payments.

3. Storefront: browsing

Pages and addresses

Every page has a real address so links can be shared and the back button works: `/`, `/shop`, one page per category (`/earbuds`, `/watches`), `/product/<slug>`, `/wishlist`, `/about`, `/contact`, `/track`, `/track/<order id>`, `/admin`. If two products share a slug, the last 5 characters of the product ID are appended.

Header

- Top announcement bar: flat delivery fee, the currently featured discount code as a click-to-copy button, and a "Track Parcel" link.
- Main bar: logo, navigation links, search box, wishlist button and bag button with item counts.
- Mobile: slide-out menu with a promo strip and a WhatsApp help button; a separate search bar.

Home page

- Hero slider mixing video and image slides, with arrows, dots and a mute toggle on video slides.
- Trust strip (icons), "shop by category" tiles, style chips that jump to a filtered shop page.
- Featured products in tabs (All and one per category).
- A plain-text "about" block with real links, for search engines.

Shop and category pages

- Category pills (hidden on a dedicated category page) and sub-category pills.
- Filters: sub-category, price range slider, in-stock only. Sort: popularity, newest, price low to high, price high to low.
- Desktop sidebar; on mobile the same filters open in a bottom sheet.
- Active-filter badges that can be removed one by one, and a results count.
- Search from the header filters this list.

Product card

- 4:5 image, second image on hover, badges (new, best seller, trending, discount), wishlist heart.
- "Only N left" notice that also opens the restock-alert form; quick-view button on desktop hover.
- Buttons: Add to Bag, and Order on WhatsApp.
- A placeholder is shown if the image fails to load, so a bad URL never breaks the grid.

Site-wide helpers

- **Quick view** popup: images, colour, quantity, add to bag, WhatsApp order, link to full details.
- **Wishlist** page, saved on the device.
- **Recently viewed** tray (last 8 products), saved on the device.
- **Mobile bottom bar**: Home, Shop, WhatsApp, Wishlist, Bag.
- **Floating WhatsApp widget**: quick prompt buttons plus a free-text box; opens WhatsApp with the message. This is for questions and does not create an order.
- **Promo popup**: once per browser session, about 10 seconds in, showing the featured discount code. Never shown over the tour, the bag or checkout, and not shown at all if no code is featured.

- **Guided "How to order" tour**: offered on the first visit; four short tours (browsing, product page, bag, checkout), each shown once, with every step in English and Roman Urdu. A "How to order?" button replays the tour for the current screen.
- **Toast notifications** for every action (added to bag, saved, errors).
- **About** page and **Contact/Help** page with WhatsApp banner, contact cards, contact form and FAQ accordion.
- **Footer**: links, social icons, contact details, featured offer reminder, payment badges, credit line.

4. Storefront: product page

- Breadcrumb; waits for the catalogue to load so a shared link works, then shows the product or a friendly "not found".
- Gallery: swipe on phones, previous/next arrows with a counter, thumbnail strip, hover magnifier on desktop.
- Full-screen zoom viewer: tap or click to zoom at that point (2.5x, up to 4x), drag to pan, pinch on phones, swipe or arrows between images.
- Badges, wishlist button, share button (native share sheet where available).
- Price with crossed-out "was" price and saving; colour selector when the product has colours.
- Quantity selector, Add to Bag (shows the line total), Instant WhatsApp Order, "Request restock notification".
- Trust lines: delivery time, exchange, Cash on Delivery.
- "Complete your setup" bundle suggestion with two complementary products.
- Tabs: details (bullet list), shipping and payment, reviews.
- City delivery checker: pick a city, see estimated days, COD availability and courier.
- Recently viewed, related products from the same category.
- Mobile sticky purchase bar with price, WhatsApp and Add to Bag.

5. Bag and checkout

Bag drawer

- Progress meter toward free delivery ("Add Rs. X more").
- Items with image, colour, quantity stepper, remove, line total.
- Discount code box with error messages, plus a one-tap "apply" for the featured code.
- Totals: subtotal, discount, delivery, total. Two buttons: Checkout, and Order on WhatsApp.
- The bag and applied discount are saved on the device.

Checkout form

- Fields: full name, WhatsApp phone, city (dropdown of major cities plus "Other"), street address, optional landmark or delivery instructions.
- Phone is validated as a Pakistani mobile, with an inline hint.
- Optional gift box and card with a note.
- Loyalty points: once a valid phone is typed, the balance is looked up and the customer can apply points (capped at 20% of the order).
- Payment choice: Cash on Delivery, or JazzCash / Easypaisa.
- Order summary with every adjustment, then the confirm button showing the final amount.
- While typing: once name and a valid phone are present, a draft (name, phone, city, bag contents, total) is saved after 1.5 seconds for abandoned-cart follow-up. The form says so.
- On submit: the order is saved, the draft is marked converted, the discount's usage count goes up by one, and the bag is cleared.

- If the online save fails, the order is still kept on the device and the customer is told to confirm on WhatsApp so the store receives it.

6. Three ways to order

All three end with an order saved in the database, so every order appears in the admin panel and triggers the email alert.

Path	How it works
Checkout	Bag, then the checkout form above, then a confirmation screen.
Order on WhatsApp	Every WhatsApp order button (bag, product page, product card, quick view) puts the product in the bag if it is not already there and opens the **same checkout form** in "WhatsApp mode". The submit button reads "Confirm & Send on WhatsApp". After the order is saved, WhatsApp opens with the confirmation message and receipt. Originally these buttons only opened WhatsApp with a message, so those orders never reached the admin panel; do not rebuild it that way.
AI chat assistant	A chat window where the customer orders by conversation in any language (Roman Urdu, Urdu, English and others). The assistant only knows the live catalogue, collects name, phone, city and address, shows a summary and waits for explicit confirmation. Then a button saves the order (marked as source "ai-chat") and opens WhatsApp with the receipt. Totals are calculated from the live catalogue by the site, never taken from the AI.

7. After the order: receipt, tracking, payment

Confirmation screen

- Thank-you with the Order ID, a "one last step" box, the receipt, and buttons for Print / Save PDF and Track Order.
- Cash on Delivery: the last step is "Confirm Order on WhatsApp"; the store dispatches only after the customer confirms.
- JazzCash / Easypaisa: the last step shows the amount, the store's wallet account(s) with a copy button, and "Send Screenshot on WhatsApp"; the store dispatches once payment is received.

Receipt

- Card with logo, Order ID and date, bill-to and deliver-to, item table, all adjustments, total, payment method (" (Paid)" once marked).
- Printing shows only the receipt, as the same bordered card centred on the page, with the browser's own header and footer removed.
- A plain-text version of the receipt is used inside WhatsApp messages.

Order tracking page

- One search box accepts an Order ID, a courier tracking number, or a phone number (phone matches only orders placed on that device).
- `/track/<order id>` opens that order directly, so the link can be shared; otherwise the customer's most recent order on this device is shown, with a list of their other orders.
- Shows status, a timeline of the forward steps, delivery details, courier and tracking number, the receipt, and help links.

- Live courier scan history is fetched from the courier's API through a server function once a tracking number exists. Only parcel progress is returned, never the consignee's name, phone or address.
- While Pending: a "waiting for your confirmation" box (COD) or "waiting for your payment" box with wallet details; "Payment received" once the admin marks it.

Manual wallet payments

- Wallet accounts (wallet name, number, account title) live in one config list. If the list is empty the customer is told the number will be sent on WhatsApp.
- The order stores when payment was received. A paid wallet order is "prepaid": messages stop saying Cash on Delivery, and the courier address copy says to collect Rs. 0.

8. Loyalty points, stock and discounts

Stock and points change only when the admin moves an order between statuses, and every change is recorded on the order so it can be reversed exactly once.

When the order becomes	What happens
Confirmed or later (first time)	Item quantities are taken out of stock. Redeemed points are deducted from the customer's balance; if the balance is too low the admin is asked whether to continue.
Delivered	5% of the item subtotal is added to the customer's points.
Cancelled or Returned	Stock is put back, deducted points are refunded and awarded points are removed.

Discount codes

- Percent off or a fixed rupee amount; optional minimum spend, expiry date and usage limit; active on/off; usage counter.
- One code can be "featured". The featured code is advertised automatically in the announcement bar, promo popup, bag, FAQ and footer. With no featured code those spots disappear.
- Customers can only look up the exact code they type; they cannot list codes.
- If the bag later drops below the minimum spend, the discount stops applying.

9. Admin panel

Lives at `/admin`, loaded only when opened so the store stays fast. Sign-in is email and password; any account other than the one admin email is signed straight out with the same message as a wrong password. Tabs carry counters (pending orders, open restock requests).

Tab	Features
Dashboard	Today's orders and revenue, this month's revenue and count, orders needing confirmation (with a count of those waiting over 24 hours), COD still to collect, average order value, 7-day bar chart, low and out-of-stock alerts, recent and pending orders, top products. "Today" uses the local calendar day.
Orders	Live list with a toast when a new order arrives. Search by ID, name, phone, city or product; status filter with counts; date filter; CSV export. Order detail: one-click "Mark as next status", set any status, Cancel, Delete, Mark payment received (wallet orders), WhatsApp button with a ready message for the current status, warning for unconfirmed orders, editable customer details, copy address for courier booking, items, courier + tracking number + internal notes, status history, printable receipt.

Products	Add, edit, delete. Fields: title, tagline, description, category, sub-category, price, "was" price, stock, rating, review count, bullet details (one per line), flags for new / best seller / trending, in stock. Images: upload several at once, each passing through an editor (crop with aspect choices, rotate, flip, brightness, contrast, saturation), or paste a URL; reorder and remove.
Inventory	Search; filter all / low / out; edit stock and price inline; toggle available / sold out; CSV export.
Customers	Built from orders, grouped by phone number: name, city, number of orders, total spent, last order date. Search, WhatsApp button, CSV export.
Abandoned carts	Checkout drafts older than 30 minutes with no order from that phone since. WhatsApp reminder with a ready message, mark as contacted, remove.
Restock requests	Grouped by product, products now back in stock first. WhatsApp message with the product link, mark as notified, remove.
Discounts	Create, edit, delete codes with all options in section 8; choose the featured code (only one at a time).

Order edit and delete rules

- Customer name, phone, city, landmark and address can be edited. Changing the phone also updates the phone key.
- If an order has already moved stock or points, the phone number is locked and the order cannot be deleted until it is cancelled, so stock and points are returned first.
- Items, quantities and prices on an order are not editable.

10. Messages and notifications

- **Customer to store (WhatsApp):** after ordering, a pre-filled message with the Order ID, total, payment method, plain-text receipt and tracking link. Wallet orders say a payment screenshot is being sent.
- **Store to customer (WhatsApp, from admin):** one ready-made message per status: ask to confirm (COD) or ask for payment with wallet details (wallet), confirmed, packed, shipped with courier and tracking number, out for delivery, delivered, cancelled, returned. Each ends with the tracking link. Asking to confirm records the time on the order.
- **New-order email to the store:** sent by a server function right after an order is saved. Subject has the Order ID, total, customer name and city; body has items, totals, payment method, customer details, notes and a button to WhatsApp the customer. Never blocks checkout.
- **Plain text only in WhatsApp links.** No emojis and no `*bold*` markers in pre-filled messages: emojis arrived as "?" boxes on some devices.

11. SEO and marketing

- Per-page title, description, canonical URL, Open Graph and Twitter tags, updated as the customer navigates. Private pages (wishlist, track, admin) are marked noindex.
- Structured data: store and website on every page, Product with price and availability on product pages.
- **Server-rendered SEO:** product and category addresses are rewritten to a server function that returns the app's HTML with the correct tags and readable content already in it, so search engines and WhatsApp/Facebook link previews work without running JavaScript. Preview images are requested as compressed JPEGs because WhatsApp ignores large images.
- Dynamic `/sitemap.xml` listing every public page and every product, read live from the database.

- `robots.txt` blocking admin, track, wishlist and API paths.
- Fallback text content inside the page root for crawlers and slow loads.
- Meta Pixel page-view tracking and a Google Analytics tag in the page head.
- Image optimisation through the image host's automatic format, quality and width options.

12. Data model

Collection (document ID)	Fields
`products` (product id)	id, name, slug, tagline, category, subCategory, price, originalPrice, discountPercentage, images[], description, details[], colors[{name, hex}], isTrending, isBestSeller, isNewDrop, inStock, stockCount, rating, reviewCount, reviews[{id, userName, userCity, rating, date, comment, verified, avatarUrl, photoUrl}]
`orders` (order id)	orderId, createdAt, source (website | ai-chat), customer{fullName, phone, email, city, address, nearestLandmark, orderNotes}, items[{productId, name, image, price, quantity, color}], subtotal, discount, discountCode, shipping, giftWrapFee, giftNote, pointsDiscount, total, paymentMethod (display label), status, statusHistory[{status, at, note}], courier, trackingNumber, adminNotes, phoneKey, stockDeducted, pointsDeducted, pointsAwarded, paymentReceivedAt, confirmationRequestedAt
`phoneLimits` (phone key)	count, windowStart (server time), lastOrderId. Written in the same batch as the order.
`customers` (phone key)	phoneKey, points, updatedAt
`discounts` (CODE in upper case)	code, type (percent | fixed), value, minSpend, description, active, featured, expiresAt, usageLimit, usedCount, createdAt
`abandonedCarts` (phone key)	phoneKey, name, phone, city, items[{name, quantity, price}], total, updatedAt, converted, orderId, contacted
`backInStock` (request id)	id, productId, productName, contact, phoneKey, createdAt, notified

Item name, image and unit price are copied onto the order at purchase time, so later product edits do not change old orders.

Saved on the customer's device (localStorage)

Bag, wishlist, applied discount, the customer's own orders, recently viewed, language, tour progress, a cache of products, and (demo mode only) discounts and restock requests. The promo popup flag is per session.

13. Security rules

The browser writes to the database directly, so the rules are the real protection. Rebuild the same guarantees on whatever backend the target project uses.

Data	Public	Admin only
Products	Read	Write
Orders	Create only if: ID matches, status is Pending, 1 to 50 items, numeric total, valid phone key, and the phone limit is updated in the same write. Read a single order by exact ID.	List, update, delete

Phone limits	Read one; create or increment only alongside a matching order, within the 3-per-24-hours rule.	List, delete
Customers (points)	Read one balance	List, write
Abandoned carts	Create or update own draft with an allowed field list and size limits	Read, delete
Restock requests	Create with an allowed field list, not yet notified	Read, update, delete
Discounts	Read one by exact code; list only featured ones; add exactly 1 to the usage count	Everything else

Admin means a signed-in user whose email equals the single admin address. Optional bot protection (App Check with reCAPTCHA v3) can be switched on with one env value.

14. Server functions and environment variables

Endpoint	Purpose and safeguards
`POST /api/chat`	AI assistant. Receives chat history and a trimmed catalogue; returns JSON with `reply`, `orderReady` and the `order` collected so far (structured output schema). Limits: 40 messages, 1,500 characters each, 300 catalogue items. Retries the main model twice, then a lighter fallback model twice.
`GET /api/track?cn=`	Courier tracking (Leopards merchant API). Validates the tracking number, 15-second timeout, returns parcel progress only.
`POST /api/notify-order`	New-order email. Receives only the Order ID, **reads the order back from the database** so the email cannot be faked, and sends only if the order is Pending and under 15 minutes old so it cannot be replayed. When misconfigured it names the missing settings.
`/api/render`	Server-side SEO for product and category pages (reached by rewrites).
`/api/sitemap`	Dynamic sitemap (reached by rewrite from `/sitemap.xml`).

Environment variable	Used for
`VITE_FIREBASE_API_KEY`, `_AUTH_DOMAIN`, `_PROJECT_ID`, `_STORAGE_BUCKET`, `_MESSAGING_SENDER_ID`, `_APP_ID`	Database and admin login (browser). Project ID and API key are also read by the server functions.
`VITE_CLOUDINARY_CLOUD_NAME`, `VITE_CLOUDINARY_UPLOAD_PRESET`	Image upload button in admin
`VITE_RECAPTCHA_SITE_KEY` (optional)	Bot protection
`GEMINI_API_KEY`, `GEMINI_MODEL` (optional)	AI assistant, server only
`LEOPARDS_API_KEY`, `LEOPARDS_API_PASSWORD`	Courier tracking, server only
`ORDER_EMAIL_USER`, `ORDER_EMAIL_APP_PASSWORD`, `ORDER_EMAIL_TO` (optional)	New-order email, server only

Server-only values must never start with `VITE_`, or they are shipped to the browser.

15. Pitfalls already solved

- **Pop-up blockers:** a WhatsApp tab opened after waiting for the order to save is blocked. Open a blank tab at the moment of the click, then point it at WhatsApp when the save finishes, and close it if the save fails.
- **Emojis in WhatsApp links** can arrive as "?" boxes. Keep pre-filled messages plain text.
- **Hosting settings need a redeploy:** new environment variables on Vercel only reach deployments built afterwards, and must be enabled for Production.
- **One repository, one hosting project:** two Vercel projects on the same repository caused settings to be added to the wrong one. Check which project owns the domain.
- **Serverless files stay self-contained:** with ES modules, imports between function files need explicit extensions at runtime, so each function repeats its small helpers.
- **Print styles:** hide everything except the receipt, fix it to the top of the page, and set the page margin to zero to drop the browser's header and footer.
- **The database rejects undefined values;** strip them before saving, and use an empty value to clear a field.
- **Local dates:** dashboard "today" must use the local calendar day, not UTC.
- **Large phone photos:** the image editor caps the longest side at 2,000 px, re-encodes files over about 9.5 MB, and detects formats the browser cannot decode.
- **Link previews:** WhatsApp ignores preview images over roughly 300 KB.

16. Questions to ask the owner; known gaps

Needed before or during the build

- Store name, logo, colours, domain, and the product categories and sub-categories.
- WhatsApp business number, admin login email, and the address that should receive order emails.
- Delivery fee, free-delivery threshold, gift box price, loyalty rates: same as section 2 or different?
- JazzCash / Easypaisa number(s) and account title.
- Courier account for tracking, AI key, image hosting account, email app password.
- Analytics and Meta Pixel IDs.

Things that are incomplete on Trendy Bazaar do not copy as-is

- **Bundle discount:** the product page advertises "bundle and save 12%", but adding the bundle only adds the items; no discount is applied in the bag. Either apply it for real or remove the claim.
- **Contact form:** shows a success message but does not send or save anything.
- **Urdu:** a small English/Urdu dictionary exists, but there is no language switch on the site.
- **Google Analytics:** the tag uses a placeholder ID.
- **Wallet accounts:** the account list is still empty.
- **Courier booking:** choosing a courier and tracking number only saves them. Booking the parcel and generating a load sheet is still done in the courier's portal.
- **Card payments:** not offered. Wallet payments are manual, with no payment gateway.
- **Reviews:** displayed from product data; customers cannot submit reviews.
- **Order items** cannot be edited after the order is placed.

17. Suggested build order

1. Foundations: shared constants, phone normalising, money formatting, data types, database access with security rules, admin sign-in.
2. Catalogue: product data, shop and category pages, product page, search, filters, product card.
3. Bag, discount codes, checkout form, order creation with the per-phone limit, confirmation screen, receipt and printing.
4. Admin: orders with the status flow, stock and points bookkeeping, then products with image upload, inventory, discounts.
5. Order tracking page and courier tracking function.
6. WhatsApp order buttons through checkout, and the status message templates.
7. New-order email function.
8. Wallet payment flow and "payment received".
9. Loyalty points at checkout, abandoned carts, restock requests, customers tab, dashboard.
10. AI chat assistant.
11. SEO: page tags, structured data, server rendering, sitemap, robots.
12. Extras: wishlist, recently viewed, quick view, zoom viewer, guided tour, promo popup, floating WhatsApp, mobile bottom bar.

After each step, type-check, try the flow in a browser, and tell the owner what was and was not verified.

18. Reference file map

Paths are inside `D:\devtimize\trendy-bazaar`.

File	Contains
`src/types.ts`	All data shapes
`src/context/ShopContext.tsx`	Routing, bag, totals, discounts, order creation, page SEO, all shared state
`firestore.rules`	Security rules
`src/lib/ordersService.ts`	Order ID generator, order save with phone limit, update, delete
`src/lib/customerService.ts`	Loyalty points, restock requests, abandoned carts
`src/lib/discountsService.ts`, `payment.ts`, `phone.ts`, `images.ts`, `cloudinary.ts`, `seo.ts`, `adminAuth.ts`, `firebase.ts`	Discount logic, wallet payments, phone normalising, image optimising and upload, SEO tags, admin sign-in, database setup
`src/components/CheckoutModal.tsx`, `CartDrawer.tsx`, `OrderReceipt.tsx`, `WalletPaymentDetails.tsx`	Checkout, bag, receipt, wallet details
`src/components/OrderTrackModal.tsx`	Tracking page
`src/components/AiChatAssistant.tsx`, `api/chat.ts`	AI assistant, front and back
`src/components/AdminManagerModal.tsx`, `src/components/admin/*`	Admin panel, one file per tab; `adminUtils.ts` holds status messages and CSV export

`src/components/ProductImageCropModal.tsx`, `ImageZoomViewer.tsx`, `GuidedTour.tsx`, `ExitIntentPromo.tsx`, `FloatingWhatsApp.tsx`, `MobileBottomNav.tsx`, `QuickViewModal.tsx`, `CompleteTheLook.tsx`, `CityDeliveryChecker.tsx`, `BackInStockModal.tsx`	The storefront extras named in sections 3 and 4
`src/pages/*`	Home, Shop, Product, Wishlist, About, Contact
`api/track.ts`, `api/notify-order.ts`, `api/render.ts`, `api/sitemap.ts`	Server functions
`vercel.json`, `vite.config.ts`, `index.html`, `src/index.css`, `.env.example`	Rewrites, dev-server API mounts, page head tags, theme and print styles, env variable names
